                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cancer. Claimed methods of detecting the presence, or of quantifying the level of expression, of the 15 kDa selenoprotein involve contacting a sample with a specific binding agent, such as a polyclonal antibody or monoclonal antibody. that specifically binds to the 15 kDa selenoprotein. A claimed method for dietary regulation comprises detecting an abnormally low expression of a 15 kDa selenoprotein in a subject and, if the level is below normal, enhancing the level by providing additional selenium in the diet. The susceptibility to cancer of a subject having an increased predetermined genetic susceptibility to cancer is reduced by administering the 15 kDa selenoprotein or by overexpressing the selenoprotein using gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        by a

                                                                                                                                                                                                                                                                                          is differentially expressed in cancer certs, such as concerded in children at position 93 that is encoded by a TGA codon in the cDNA (see AAZ34468). Polymorphisms in the human 15 kDa selenoprotein gene are associated with susceptibility to cancer. Claimed methods of detecting the presence, or of quantifying the level of expression, of the 15 kDa selenoprotein involve contacting a sample with a specific binding agent, such as involve contacting a sample with a specific binding agent, such as
                                                                                                                                                   a polyclonal antibody or monoclonal antibody, that specifically binds to the 15 kDa selenoprotein. A claimed method for dietary regulation comprises detecting an abnormally low expression of a mammalian 15 kDa selenoprotein in a subject and, if the level is below normal, enhancing the level by providing additional selenit in the diet. The susceptibility to cancer of a subject having an increased predetermined genetic susceptibility to cancer is reduced by administering a mammalian 15 kDa selenoprotein or by
                                                                                              Sequence
                                                                                                                                     overexpressing the selenoprotein using gene therapy.

                                                                                                                          This sequence represents a secreted human protein encoded by the gene clane detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAX00602) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 87 novel genes and their fragments (nucleic acid sequences: AAX00611-X00724; amino acid sequences AAW67807-W68004) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polymetides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 87 polynucleotides, based on which tissues they are most highly expressed in (see AAX00611 for described uses).
                                                                                                                                                                                                                                                                                                                                                                                                           Rosen
                                                                                                                                                                                                                                                                                                                           New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders

CC AAZ42255 to AAZ43075 represent novel 5' expressed sequence tag (EST)
CC sequences, corresponding to human secreted proteins. AAY64651 to
CC AAZ43052. The 5' ESTs can be used for producing secreted human gene
CC products. They can be used to identify and isolate 5' untranslated
CC regions (UTRs) and upstream regulatory regions which control the
CC location, development stage, rate, and quantity of protein synthesis, as
CC well as stability of mRNA. The ESTs are also useful as probes for
CC chromosome mapping, and to obtain full length cDNA clones. The ESTs can
CC diagnostic procedures to identify individuals, or in
CC diagnostic procedures to identify individuals having genetic diseases
CC gene therapy protocols. The nucleic acids encoding signal peptides can be
CC used for directing extracellular secretion of a polypeptide or the
CC insertion of a polypeptide into a membrane, or importing a polypeptide
CC treating a variety of human conditions. Secreted proteins have
CC therapeutic value, and the identification of reas secretion have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               멍
                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                       proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome polynucleotides may be used for detection of prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; prostate cancer; prostate cancer antigen; detection; neuroprotective; cytostatic; cardioactive; immunomodulatory; vulnerary; gastrointestinal; nephrotropic; antiinfective; antibacterial; gene therapy; neural; immune; reproductive; restrointestinal; pulmonary; cardiovascular; proliferative of gastrointestinal; pulmonary; cardiovascular; proliferative of the control of the cardiovascular; proliferative of the cardiovascular of the card

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from prosophila. The inventuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence data specification, but
                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; SEQ ID NO 16749; 21pp + Sequence Listing;

CC include, immunosuppressive; antiarthritic; antirheumatic;
CC antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective;
CC nootropic; neuroprotective; antibacterial; virucide; fungicide;
CC opthalmalogical; and vulnerary activity. The protein and polynucleotide
CC sequences, their agonists and antagonists may be useful for treating,
CC preventing and diagnosing diseases and disorders such as autoimmune
CC diseases e.g. rheumatoid arthritis, hyperproliferative disorders
CC e.g. neoplasms of the breast or liver, cardiovascular disorders
CC e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia,
CC angiogenesis, nervous system disorders e.g. cerebral ischaemia,
CC infections caused by bacteria, viruses and fungi and ocular disorders
CC e.g. corneal infection. The polypeptides can also be used to aid wound
CC e.g. corneal infection. The polypeptides can also be used to aid wound
CC e.g. corneal infection organs before transplantation, for supporting cell
CC culture of primary tissues, to regenerate tissues and in chemotaxis. The
CC polypeptides can also be used as a food additive or preservative to
CC increase or decrease storage capabilities. Included in the invention are
CC oligonucleotides Aar63780 - Aar63788 and peptide AAB75239 which are used
CC in the identification and characterisation of the DNA and protein

CC which encode human secreted proteins AAB75280. AAB75287. Included in the CC invention are protein sequences AAB75281. Included in the CC invention are protein sequences AAB75281. AAB75341 which are fragments CC of the secreted proteins and amino acid sequences with which these CC fragments share homology. Examples of the activities of the proteins and CC polynucleotides and the activities of their agonists and antagonists (CC include, immunosuppressive; antiarthritts; antirhemmatic; cardiant; vasotropic; cerebroprotective; (CC antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; (CC opthalmalogical; and vulnerary activity. The protein and polynucleotide sequences, their agonists and antagonists may be useful for treating, (CC preventing and diagnosing diseases and disorders such as autoimmune CC diseases e.g. rheumatoid arthritis, hyperproliferative disorders (C. e.g. neoplasms of the breast or liver, cardiovascular disorders (C. e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, (C. e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, (C. e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, (C. e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, (C. e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, (C. e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, (C. e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, (C. e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, (C. e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, (C. e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, (C. e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, (C. e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, (C. e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, (C. e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, (C. e.g. cardiac arr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      neuroprotective; antibacterial; varuadde; fungicide; cerebroprotective; vulnerary; autoimmune disease; hyperproliferative disorder; cancer; cardiovascular disorder; cerebrovascular disorder; cerebrovascular disorder; cerebrovascular disorder; ocular disorder; o

in AAB43398 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antiviral; antiinflammatory; antithyroid; antiallergic; antibacterial; antiviral; dermatological; neuroprotective; cardiant; thrombolytic; coagulant; nootropic; vasotropic; antipsortatic and antiangiogenic. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions.

                                                                              Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoletic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC7849 to AAC78457 and AAB44240 represent sequences used in the exemplification of
                                                           the present invention.

Claimed methods of detecting the presence, or of quantifying the level of expression, of the 15 kDa selenoprotein involve contacting a sample with a specific binding agent, such as a polyclonal antibody or monoclonal antibody, that specifically binds to the 15 kDa selenoprotein. A claimed method for dietary regulation comprises detecting an abnormally low expression of a 15 kDa selenoprotein in a subject and, if the level is below normal, enhancing the level by providing additional selenium in the diet. The susceptibility to cancer of a subject having an increased predetermined genetic susceptibility to cancer is reduced by administering the 15 kDa selenoprotein or by overexpressing the selenoprotein using gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2000-013045/01.

                                                                                                                                                                    This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAX00602) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 87 novel genes and their fragments (nucleic acid sequences: AAX00611-X00724; amino acid sequences AAW67807-W68004) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polynucleotides. Specific uses are described for each of the 87 polynucleotides, based on which tissues they are most highly expressed in (see AAX00611 for described uses).
                                                                                                                                                                                                                                                                                                                                               Claim 11; Page 310; 385pp; English.

                                                                                                                                                                                              sequences, corresponding to human secreted proteins. AAV64651 to AAV65438 represent the EST-related proteins corresponding to AAAV65438 represent the EST-related proteins corresponding to AAAV2265 to AAX46522. The 5' ESTs can be used for producing secreted human gene products. They can be used to identify and isolate 5' untranslated regions (UTRs) and upstream regulatory regions which control the location, development stage, rate, and guantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals, or in diagnostic procedures to identify individuals having genetic diseases resulting from abnormal gene expression. The products may also be used in gene therapy protocols. The nucleic acids encoding signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; 5' EST; expressed sequence tag; secreted protein; diagnosis; gene therapy; chromosome mapping; upstream regulatory sequence; forensic; location; development; protein synthesis; stability; regulation; identification.
                                                           treating a variety of human conditions. Secreted proteins have therapeutic value, and the identification of new secreted proteins valuable. AAA242249 to AAA242264 and AAY64644 to AAY64650 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel secreted protein 5' expressed sequence tag sequences used in diagnostic, forensic, gene therapy, and chromosome mapping procedures

e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotraxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. Included in the invention are oligonucleotides AAF63780 - AAF63788 and peptide AAB75239 which are used in the identification and characterisation of the DNA and protein sequences of the invention.
                                                                                                                                                                                                                                                                                    of the secreted proteins and amino acid sequences with which these fragments share homology. Examples of the activities of the proteins and polynucleotides and the activities of their agonists and antagonists include, immunosuppressive; antiarthritic; antirhemmatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungicide; opthalmalogical; and vulnerary activity. The protein and polynucleotide sequences, their agonists and antagonists may be useful for treating, preventing and diagnosing diseases and disorders such as autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to polynucleotide sequences AAF63789 - AAF63836 which encode human secreted proteins AAF5260 - AAF5287. Included in tlinvention are protein sequences AAF5288 - AAF541 which are fragments of the secreted proteins and amino acid sequences with which these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; neuroprotective; antibacterial; virucide; fungicide; opthalmalogical; vulnerary; autoimmune disease; hyperproliferative disorder; cancer; cardiovascular disorder; cerebrovascular disorder; infection; nervous system disorder; ocular disorder; chemotaxis; food additive;

      This invention relates to polynucleotide sequences AAF63789 - AAF63836 CC which encode human secreted proteins AAB75280 - AAB75287. Included in the CC invention are protein sequences AAB75288 - AAB75287. Included in the CC invention are protein sequences AAB75288 - AAB75287. Included in the CC invention are protein sequences with which these CC fragments share homology. Examples of the activities of the proteins and CC polynucleotides and the activities of their agonists and antagonists of include, immunosuppressive; antiarthritic; antirheumatic; CC include, immunosuppressive; antiarthritic; antirheumatic; CC include, immunosuppressive; antiarthritic; antirheumatic; CC include, immunosuppressive; antibatterial; virucide; fungicide; CC include, immunosuppressive; antibatterial; virucide; fungicide; CC opthalmalogical; and vulnerary activity. The protein and polynucleotide cc sequences, their agonists and antagonists may be useful for treating, CC opthalmalogical; and vulnerary activity. The protein and polynucleotide cc sequences, their agonists and antagonists may be useful for treating, CC opthalmalogical; and diseases and disorders such as autoimmune cc diseases e.g. rheumatoid arthritis, hyperproliferative disorders cc. e.g. cardiac arrest, cerebrovascular disorders cc. e.g. cardiac arrest, cerebrovascular disorders cc. e.g. cardiac arrest, cerebrovascular disorders cc. angiogenesis, nervous system disorders e.g. cerebral ischaerder. CC infections caused by bacteria, viruses and fungi and ocular disorders cc. corneal infection. The polypeptides can also be used to ald wound the challenge of brimary tissues, to regenerate tissues and in chemotaxis. The culture of brimary tissues, to regenerate tissues and in chemotaxis. The

        AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidabetic; antiasthmatic; antirheumatic; antiartritic; antiinflammatory; antithyroid; antirheumatic; antiartritic; coagulant; neuroprotective; cardiant; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic and antiangiogenic. The polynucleotides and polypeptides can be used for preventing, treating of ameliorating medical conditions and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists, and antagonists from

Best Local
regions (UTRs) and upstream regulatory regions which control the location, development stage, rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals, or in diagnostic procedures to identify individuals having genetic diseases resulting from abnormal gene expression. The products may also be used in the protection of the products of the products may also be used the protection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAB44240 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             gene therapy; chromosome mapping; upstream regulatory sequence; forensic; location; development; protein synthesis; stability; regulation; identification.
                                                                                                                   sequences, corresponding to human secreted proteins. AAY6451 to AAX65438 represent the EST-related proteins corresponding to AAX42265 AAX43052. The 5' ESTs can be used for producing secreted human gene products. They can be used to identify and isolate 5' untranslated
                                                                                                                                                                             AAZ42265 to AAZ43075 represent novel 5' expressed sequence tag (EST)

                                                            useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL/16176-ABL30511), expressed DNA sequences (ABL/16176-ABL30511), expressed DNA (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypept into a cell. The proteins encoded by the EST sequences may be usefu treating a variety of human conditions. Secreted proteins have therapeutic value, and the identification of new secreted proteins valuable.                   CC polypeptides. The proteins and their associated DNA sequences are used in Cc the treatment, prevention and diagnosis of medical conditions caused by CC P. acnes. The disorders include SAPHO syndrome (synovitis, acne, CC pustulosis, hypertosis and osteomyelitis), uveitis and endopthalmitis. CC P. acnes is also involved in infections of bone, joints and the central CC nervous system, however it is particularly involved in the inflammatory CC lesions associated with acne vulgaris. A method for detecting the CC presence or absence of P. acnes in a patient comprises contacting a CC sample with a binding agent that binds to the proteins of the invention CC and determining the amount of bound protein in the sample. The CC polypeptides may be used as antigens in the production of antibodies CC specific for P. acnes proteins. These antibodies can be used to CC downregulate expression and activity of P. acnes polypeptides and CC diagnostic agents for determining P. acnes presence, for example, by CC enzyme linked immunosorbent assay (ELISA).

CC Note: The sequence data for this patent did not form part of the printed CC specification, but was obtained in electronic format directly from WIPO CC at fig. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁

Ruben SM,
This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAX84924) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 125 novel genes and their fragments (nucleic acid sequences: AAX84933-X85057; amino acid sequences AAY27567-Y27933) which are useful for preventing, treating or ameliorating medical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; secreted protein; fusion protein; gene therapy; protein therapy; diagnosis; tissue; cancer; tumour; neurodegenerative disorder; leukaemia; developmental abnormality; foetal deficiency; blood; alleray; renal; immune system; asthma; lymphocytic disease; brain; hepatic; lymphoma; inflammation; ischaemic shock; Alzheimer's disease; restenosis; AIDS; cognitive disorder; schizophrenia; prostate; obesity; osteoclast; thymus; osteoporosis; arthritis; testis; lung; thyroiditis; thyroid; digestion;

polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosts of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 125 polynucleotides, based on which tissues they are most highly expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2001-616774/71.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAG08634 standard; Protein; 149 AA.

              556 del A is a frameshift mutation in exon 4 and results in shortened polypeptides significantly different from the single amino acid deletions or alterations.

The mutant CF gene when expressed in cells of the human body, is associated with altered cell function which correlates with the genetic disease cystic fibrosis.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
